Colyer J;

Pandya MJ,

New protein structures with peptide mondmer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nandscale molecular sieves.

Claim 16; Page 26; 45pp; English.

The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-plC

The present sequence is that of self-assembling peptide fibre (SAF) SAF-pl. The invention relates to fibre-haping (Fish) peptides ADM41434-ADM41435 that are capable of interacting with SAFs to form protein structures. The Fish peptides allow morphological changes (branches, splits, kinks and bends) to be made to protein fibres comprising SAFs. By incorporating such morphological changes in the protein fibres, it is possible to generate a variety of (nanoskale) protein structures, such as assemblies in general, including matrix, filter, network, grid and scaffold structures. Use of the protein btructures in the purification of biological fluids, for assembling cells for cell and tissue engineering, and in surface engineering procedures is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second useptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-pl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present sequence is that of self-asdembling peptide fibre (SAF) SAF-p2a. The invention relates to fibre-shading (FiSh) peptides ADM41434-ADM41435 to fare capable of interacting with SAFs to form protein structures. The FiSh peptides allow morphological changes (branches, splits, kinks and bends) to be made to protein fibres comprising SAFs. By incorporating such morphological of the protein fibres, it is possible to generate a variety of (nanoscale) protein structures, such as assemblies in general, including matrix, filter, network, grid and scaffold structures. Use of the protein structures in the purification of biological fluids, for assembling cells for cell and tissue engineering, and in surface engineering procedures is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel fiber-shaping peptide comprising hub and several peptide monomer units, useful for producing protein structure useful in purification of biological fluids and in surface enginedring procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               64.4%; Score 85; DB 8; Length 28;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p1B
                                                               The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second septide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-plA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sleves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is a peptide used to form blunt-ended heterodimers
                                       The
peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Porce Microscopy and a number of other applications, present sequence is the peptide monomer unit SAF-p2D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p2A
                                                                                                                                                                                                                                                                                   New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a protein structure with several first

                                                                                                    The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second speptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p2B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p2C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Force
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
New protein structures with peptide mondmer units, useful in Atomic E
Microscopy, purifying biological fluids, promoting tissue repair and
tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New protein structures with peptide monomer units, useful in Atomic Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sleves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 28;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second upptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAP-p2
                                                                                                                                                                                                                                                                                                                                                                                               New protein structures with peptide monomer units, useful in Atomic F
Microscopy, purifying biological fluids, promoting tissue repair and
tissue engineering, or constructing nanoscale molecular sieves.

The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p3
                                                                                      New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                    The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Porce Microscopy and a number of other applications. The present sequence is a peptide used to form blunt-ended heterodimers
                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                           .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second upptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAP-p2E
                                                                                                                                                                                                                                                                                                                                                                                         New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

The present invention relates to a composition which comprises a pair of antibody FV fragments linked and stabilised by antiparallel heterogeneous alpha-helical coiled-coil (AHEC) peptides. The composition is used to form multimeric complexes and therapeutic antibodies and antibody fragments useful for e.g. inhibition of receptor binding and the trargeting of drugs, toxins and labels in research, industry and healthcare. The present sequence is an AHEC peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                          Composition useful for forming therapeutic antibodies and antibody fragments comprises pair of antibody Fv fragments linked and stabilized by antiparallel heterogeneous alpha-helical coiled-coil peptides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a composition which comprises a pair of antibody FV fragments linked and stabilised by antiparallel heterogeneous alpha-helical colled-coil (AHEC) peptides. The composition is used to form multimeric complexes and therapeutic antibodies and antibody fragments useful for e.g. inhibition of receptor binding and the rargeting of drugs, toxins and labels in research, industry and healthcare. The present sequence is an AHEC peptide used in the exemplification of the invention

The sequence represents a synthetic polypeptide comprising heptad units of the peptide. The synthetic polypeptide can be expressed in vivo in plants to serve as a synthetic seed storage protein which can be custom-tailored for specific end-user requirements. The DNA encoding the heptad may be used to transform plants to increase the content of partic. anino acids such as lyaine or methionine in seeds or leaves. See also AAR31980-6 and AAR32659-705. (Updated on 25-MAR-2003 to correct PN field.)
                                                          The present invention relates to a peptide with a series of heptadrepeats that mimic a transmembrane domaih and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrins is involved, such as inflammation, thrombosis and malignancy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic polypeptide(s) contg. specified heptad units - exp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is given in a specification relating to a polypeptide comprising a series of heptad-repeats that minds a transmembrane domain, and a selected cytoplasmic domain attached to the heptad repeats. At least a portion of the polypeptide is prepared recombinantly or at least 1 heptad repeat in the series has a different amin oacid sequence to other heptad repeats in the series. The polypeptide is useful in the construction of structural models which are useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein having the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying the structural model with paxillin or paxillin related molecule in the presence and absence of a test agent and determining binding of paxillin related molecule to the structural model. A decrease in binding in the presence of the test agent indicates that the test agent is an inhibitor of alpha4 integrin biological response. Inhibitors of the binding of paxillin to alpha4 are useful in blocking inminitions such as inflammatory bowel disease, inhibitors and parallin to alpha4 are useful in blocking interval and a paxillin to alpha4 are useful in blocking inminitions such as inflammatory bowel disease,

The invention relates to a novel polypeptide capable of inducing the potentiation of antibody production when transmucosally having a sequence of in which the amino acid sequence of an adhesion motif of a cell adhesion consecuted is bonded to the polypeptide. The novel polypeptide comprises a peptide consisting of an amino acid sequence of a B cell epitope's amino consecution and the amino acid sequence of a B cell epitope's amino consecution and the amino acid sequence of a B cell epitope's carboxy terminal side and having a linker peptide between the amino acid sequences. The invention further comprises: novel DNA or RNA which can comprise in a composition or man and plants which have consecuted and a composition comprising the novel colypeptide and an additive for the formulation. The novel polypeptide or has the following activities: antibacterial, neuroprotective, nootropic, and virucide. The novel polypeptide is useful for producing antibodies in animals, for composition are useful for producing antibodies in animals, for preventing or treating diseases. The novel polypeptide is useful as an adjuvant to increase the antibody producing an antibody against toxins of a pathogenic virus and microorganisms, thus effective in preventing or treating infectious disease such as food poisoning. The novel polypeptide is useful for treating antibody against amyloid beca-peptide. The novel polypeptide is also useful for treating dental caries. This sequence répresents a peptide relating to treating the invention of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide having a sequence in which an adhesion motif of a cell adhesion molecule is bonded to a polypeptide comprising a T cell epitope and a B cell epitope, and a linker peptide, useful for producing antibodies.
infectious disease; food poisoning; Alzheimer's disease; amyloid beta-peptide; dental; MHC; major histocompatibility complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 41; DB 8; Length 20; Pred. No. 1.56+02;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SSP7 polypeptide, suitable for in vivo expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heptad; plants; custom tailored storage proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a composition which comprises a pair of antibody Fv fragments linked and stabilised by antiparallel heterogeneous subha-helical colled-coil (AHEC) peptides. The composition is used to form multimeric complexes and therapeutic antibodies and antibody fragments useful for e.g. inhibition of receptor binding and the rargeting of drugs, toxins and labels in research, industry and healthcare. The present sequence is an AHEC peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition useful for forming therapeutic antibodies and antibody fragments comprises pair of antibody Fv fragments linked and stabilized by antiparallel heterogeneous alpha-helical coiled-coil peptides.

Oligonucleotide SM98 (AAQ95000) and complementary sequence SM99 (AAQ95001) code for 4 repeats (AAR78256) of heptad peptide SSP7 (see also AAR78237). Clone 5-1 (AAQ95005) was obtd. by insertion of the oligonucleotides into the Earl site of clone 84-H3 (see AAQ94993) and transformation of Escherichia coli DH5 alpha. Synthetic storage protein SSP5-1 (AAR78259) encoded by the construct can be used to raise the
       New chimeric gene providing increased lythine content in plant seeds -contains di:hydro:di:picolinic acid synthase gene coupled to chloroplast transport sequence and seed specific promoter, also new plants of improved nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lysC; transgenic; lysine accumulation; dihydrodipicolinic acid synthase; DHDPS; lysine inhibition; lysine ketoglutarate reductase; LKR; chloroplast transit sequence; CTS; aspartokinase III; AKIII; synthetic seed storage protein; SSP.

                                                                                                                                                                                                                                                                                                      The sequence represents a synthetic polypeptide comprising heptad units of the peptide. The synthetic polypeptide can be expressed in vivo in plants to serve as a synthetic seed storage protein which can be customtailored for specific end-user requirements. The DNA encoding the heptad may be used to transform plants to increase the content of partic. amino acids such as lysine or methionine in seeds or leaves. See also AAR31979-86 and AAR32659-705. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                       Synthetic polypeptide(s) contg. specified heptad units - expressed in vivo in plants to serve as custom-tailored storage proteins with specified aminoacid content.

ketoglutarate reductase (LKR) or its subfragment. The nucleotide fragment is operably linked to a plant chloroplast transit sequence (TS) and the plant lysine ketoglutarate reductase subfragment is used in antisense inhibition or cosuppression. Also included are progeny plants from the above mentioned plant especies. The seeds obtained from the above mentioned plant (e.g., rapessed.) The seeds obtained from the above mentioned plant (e.g., rapessed.) The seeds obtained from the above mentioned plant (c.g., rapessed.) The seeds of a higher level, preferably at a level of at least 10% higher than seeds of a plant that do not comprise the foreign nucleic acid aspartokinase III (from the lysC gene) of B. Coli (mutated to be lysine-insensitive) are also used to generate the above transgenic plants. Also disclosed are synthetic seed storage proteins (SSP) used as an internal cource of lysine, built up from synthetic peptide monomers based around an Earl site sequence (for generating mutilmeric proteins). The present sequence is an SSP peptide monomer.

encoding aspartokinase and dihydrodipicolinic increasing threonine or lysine content of seeds acid synthase, useful for of plant.

Example 21; Page 44; 116pp; English.

The invention relates to an isolated nucleic acid fragment comprising a first nucleic acid subfragment encoding aspartokinase (AK) that is substantially insensitive to inhibition by lysine, and a second nucleic

WPI; 2005-065280/07.

c: acus substrantially insensitive to inhibition by lysine. Also included are an substrantially insensitive to inhibition by lysine. Also included are an isolated nucleic acid fragment comprising a nucleic acid subfragment comprising a nucleic acid diverse reductase (IKR), a chimaeric gene (where crocked nucleic acid fragment is operably linked to a plant chloroplast transit sequence and to a seed specific regulatory sequence, a plant cromprising the nucleic acid/chimaeric gene in its genome, a seed obtained from the plant, increasing threonine or lysine content of the seeds of plant having the ability to produce levels of free threonine or lysine at comprising the ability to produce levels of free thranchic or lysine at a level at least tan percent to four-fold higher than the seeds of plants, a transformed soybean) plant comprising seeds that accumulate lysine to a level at least ten percent to four-fold higher than the seeds of an untransformed plant, a monocot plant accumulate lysine to a level between ten percent and one hundred percent higher that of the seeds of an untransformed plant, a monocot plant comprising in its genome the nucleic acid fragment having the monocot comprising in its genome the nucleic acid fragment than one hundred percent higher than the seeds of the untransformed plant. Also threat accumulate lysine to a level between ten percent and one hundred contribute based oligonucleic acid fragments (seeds the transformed plant and one hundred plant. The nucleic acid fragments genes and methods are useful for increasing threonine or lysine content eliminate the need to containing increased threonine or lysine content eliminate the need to supplement mixed grain feeds with lysine or threonine produced via microbial fermentation. The present sequence is a lysine-rich heptad cepeace of the prosessed storage protein crepest for use as a monomer unit in a synthetic seed storage protein ö Gaps transgenic plant; amino acid production; seed; enzyme engineering. ö 30.3%; Score 40; DB 6; Length 28; 25.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAR76749-62 represent peptide fragments which were used in adhesion assays with the FimH protein from E. coli strain CSH-50 to test the binding of the MFP class of Fimi adhesins. Most forms of the FimH adhesin target, and bind to, oligosaccharide structures containing terminally located alpha-D-mannoside residues. FimH contains 4 cysteine residues assumed to direct folding of the molecule into distinct functional domains. For comparison Finh and the minor components FimF and FimG only have 2 cysteine residues. The localisation of the cysteine residues in FimH points to a tandem arrangement of two ancestral genes. Similar amino acids can be found in similar positions in the two halves
                                                                                                                                                    The invention relates to a novel isolated nucleic acid sequence which is useful in antisense inhibition or sense suppression of endogenous lysine ketoglutarate reductase/saccharopine dehydrogenase activity in a corn plant corn plant cell, where the isolated nucleic acid fragment comprises all or a part of a nucleic acid sequence (ADW71743). The isolated nucleic acid fragment is useful for increasing levels of lysine in the seeds of transformed plants. The present sequence represents a peptide encoded by an oligonucleotide used to create chimeric genes of
                                      New isolated lysine ketoglutarate reductase/saccharopine dehydrogenase nucleic acid fragment, useful for increasing levels of lysine in the seeds of transformed plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  type 1 fimbriae, organelle, adhesin, alpha-D-mannoside residue, PimF, FimG, receptor binding site; MEP class; MF class; M class.

                                                                                                                                                                                                                                       The sequence represents a synthetic heptad polypeptide which can be expressed in vivo in plants to serve as & synthetic seed storage protein which can be custom-tailored for specific end-user requirements. The DNA encoding the heptad may be used to transform plants to increase the content of partic. anino acids such as lysine or methionine in seeds or leaves. See also ARR31979-86 and ARR32659-705. The DNA encoding the heptad may be used to transform plants to increase the content of partic, amino acids such as lysine or methionine in seeds or leaves. The synthetic polypeptide can be expressed in vivo in plants to serve as a synthetic seed storage protein which can be customtailored for specific end-user requirements. The DNA encoding the heptad may be used to transform plants to increase the content of partic. amino acids such as lysine or methionine in seeds or leaves. See also AAR31979-86 and AAR32659-705. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New chimeric gene providing increased lysine content in plant seeds - contains di:hydro:di:picolinic acid synthase gene coupled to chloroplast transport sequence and seed specific promoter, also new plants of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Lysine-rich synthetic storage protein SSP 5.5.5 (AAR78250) comprises 2 heptad SSPs repeats (see AAR78238) flanked by SSPS heptads (see AAR78236) derived from vector pSK6. It was obtd. by insertion of HPLC-purified SSP5 encoding oligonucleotides (AAQ94974-75) into pSK6 and use of the resulting vector to transform Escherichia coli willO3, yielding clone 84-fl3 (AAQ94933). The SSP forms a coiled-coil structure. It can be expressed in the seeds of transformed plants, e.g. soybean and corn, to increase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lysine-rich synthetic storage protein SSP 5.5.5 (AAR78244) comprises 2 hepted SSPs repeats (see AAR78234) flanked by SSPS hepterads (see AAR78236) hepted from vector pSK6. It was obtd. by insertion of SSP5-encoding oligonucleotides (AAQ94974-75) into pSK6 and use of the resulting vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New chimeric gene providing increased lytine content in plant seeds -contains di.hydro:di.picolinic acid synthase gene coupled to chloroplast transport sequence and seed specific promoter, also new plants of improved nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lysine; synthetic storage protein; SSP; vector; pSK6;
dihydrodipicolinic acid synthase; corn; maize; Zea mays; soybean;
Glycine max; transgenic plant; essential amino acid.

It was obtd. by insertion of SSP5-encoding oligonucleotides (AAQ94974-75) into pSK6 and use of the resulting vector to transform Escherichia coli JM103, yielding clone D16 (AAQ94981). The SSP forms a coiled-coil structure. It can be expressed in the seeds of transformed plants, e.g. soybean and corn, to increase lysine content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New chimeric gene providing increased lysine content in plant seeds -contains di:hydro:di:picolinic acid synthase gene coupled to chloroplast transport sequence and seed specific promoter, also new plants of improved nutritional value.
to transform Escherichia coli JM103, yielding clone D33 (AAQ94983). The SSP forms a coiled-coil structure. It can be expressed in the seeds of transformed plants, e.g. soybean and corn, to increase lysine content

The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and to positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha -helix, whereby the multimer is amphipathic

Chimeric genes encoding lysine production enzymes - useful for increasing transgenic seed lysine content without being inhibited by high levels of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Dihydrodipicolinic acid synthase; DHDPS; chimeric gene; storage protein; lysine inhibition; plant chloroplast transit sequence; plant seed-specific regulatory sequence; transgenic plant; increased lysine level; corn; Zea mays; soybean; Glycine max.
                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a synthetic lysine rich, storage protein of the specification. The sequence can be operably linked to a seedspecific regulatory sequence to create a chimeric gene of the specification. The specification also describes a Corynebacterium dapa gene, which encodes a dihydrodipicolinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chloroplast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, segecially in corn (Zea mays) and soybean (Glycine max). (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28.0%; Score 37; DB 2; Length 28; 25.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mamalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively positively charged amino acid residues. The nonpolar amino acid residues and two positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues are distributed within the metad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha helix, whereby the multimer is amphipathic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Selective lysis of bacteria amongst mammalian cells - using 14-mer or 21-
mer lytic peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Dihydrodipicolinic acid synthase; DHDPS; chimeric gene; storage protein; lysine inhibition; plant chloroplast transit sequence; plant seed-specific regulatory sequence; transgenic plant; increased lysine level; corn; Zea mays; soybean; Glycine max.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chimeric genes encoding lysine production enzymes - useful for increasing transgenic seed lysine content without being inhibited by high levels of the amino acid.
                                                             Chimeric genes encoding lysine production enzymes - useful for increasing transgenic seed lysine content without being inhibited by high levels of the amino acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Dihydrodipicolinic acid synthase; DHDPS; chimeric gene; storage protein; lysine inhibition; plant chloroplast transit sequence; plant seed-specific regulatory sequence; transgenic plant; increased lysine level; corn; Zea mays; soybean; Glycine max.
                                                                                                                         The present sequence represents a synthetic lysine rich, storage protein of the specification. The sequence can be operably linked to a seedspecific regulatory sequence to create a chimeric gane of the specification. The specification also describes a Corynebacterium daph gene, which encodes a dihydrodipicolinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chloroplast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, especially in corn (Zea mays) and soybean (Glycine max). (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                   ö

                                            The present sequence represents a synthetic lysine rich, storage protein of the specification. The sequence can be operably linked to a seedspecific regulatory sequence to create a chimeric gene of the specification. The specification also describes a Corynchacterium daph gene, which encodes a dihydrodipicolinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chimeric endoroglast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, sepecially in corn (Zea mays) and soybean (Glycine max). (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of a lysine-rich synthetic seed storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27-MAR-1997;
```

quality of seeds from transgenic plants by increasing lysine content

```
ö
protein (SSP) composed of SSP5 heptad repeats (sequence by heptad repeat is 5.5.5. A synthetic gene (see AAV99516) encoding the SSP was constructed by insertion of SSP5-encoding oligonucleotides (see AAV99507) into a unique Earl site in the SSP5-encoding 'base gene' (see AAV99507) of vector pSK5. Chimeric genes for lysine-rich synthetic seed storage proteins suitable for expression in the seeds of plants have been constructed. The invention provides methods for improving the nutritional quality of seeds from transgenic plants by increasing lysine content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the amino acid sequence of a lysine-rich synthetic seed storage protein (SSP) composed of SSP5 heptad repeats (sequence by heptad repeat is 5.5.5.5. A synthetic gene (see AAV9518) encoding the SSP was constructed by insertion of SSP5-encoding oligonuclectides (see AAV99507) into a unique Earl site in the SSP5-encoding 'base gene' (see AAV99505) of vector pSKS. Chimeric genes for lysine-rich synthetic seed storage proteins suitable for expression in the seeds of plants have been constructed. The invention provides methods for improving the nutritional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids and chimeric genes for increasing seed lysine content comprise sequence encoding all or part of lysine ketoglutarate reductase, useful to improve nutritional quality of seeds from transformed plants.
                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of a lysine-rich synthetic seed storage protein (SSP) composed of SSP5 repeats (sequence by heptad repeat is 5.5.5.9. A synthetic gene (see AAV99528) encoding the SSP was constructed by insertion of SSP5-encoding oligonucleotides (see AAV99507) into a unique Earl site in the SSP5-encoding 'base gene' (see AAV99507) of vector pSK6. Chimeric genes for lysine-rich synthetic seed storage proteins suitable for expression in the seeds of plants have been constructed. The invention provides methods for improving the nutritional quality of seeds from transgenic plants by increasing lysine content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids and chimeric genes for increasing seed lysine content -comprise sequence encoding all or part of lysine ketoglutarate reductase, useful to improve nutritional quality of seeds from transformed plants.

The TRAIL polypeptides are useful in killing cancer cells, in treating viral infections (e.g. bovine viral diarrhoea or human immunodeficiency virus (HIV)) and cancers (e.g. leukaemia, lymphoma and melanoma), as a research reagent useful in studying apoptosis including the regulation of programmed cell death. TRAIL DNA sequences may be employed in developing a gene therapy approach to treating disorders mediated by defective or insufficient amounts of TRAIL, in the production of TRAIL polypeptides and as probes or primers in polymerase chain of TRAIL polyperates or primers in polymerase chain promotes the trimerisation of TRAIL protein the resulting trimeric TRAIL protein has enhanced biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New tumor necrosis factor related apoptosis inducing ligand polypeptides for treating viral infections (e.g. bovine viral diarrhea or human immunodeficiency virus), or cancers (e.g. leukemia or lymphoma).

The invention relates to a cytokine designated as tumour necrosis factor (TMF) related apoptosis inducing ligand; (TRAIL), which induces apoptosis of certain target cells, including cancer cells and virally infected cells. The TRAIL polypeptides are useful in killing cancer cells, in treating viral infections (e.g. bovine viral diarrhoea or human cimmunodeficiency virus (HIV)) and cancers (e.g. leukaemia, lymphoma and malanoma), as a research reagent useful in studying apoptosis including the regulation of programmed cell death. TRAIL DNA sequences may be employed in developing a gene therapy approach to treating disorders mediated by defective or insufficient amounts of TRAIL, in the production of TRAIL polyperides and as probes or primers in polymerase chain creactions (PCR). The present sequence if a leucine zipper peptide that promotes the trimerisation of TRAIL protein. The resulting trimeric TRAIL protein has enhanced biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New tumor necrosis factor related apoptosis inducing ligand polypeptides for treating viral infections (e.g. bovine viral diarrhea or human immunodeficiency virus), or cancers (e.g. leukemia or lymphoma).

A, Molecule type: protein
A, Relecule type: protein
A, Relecule 1-28 - Accession  
A, Cross-references: UNIPROT: Q7M552; UNIPARC: UPI0000177283
A, Note: the protein is designated as ribosomal protein HS20
A, Note: the protein is designated as Halobacterium cutirubrum C; Superfamily: Escherichia coli ribosomal protein S8
C; Keywords: protein biosynthesis; ribosome

2-phosphinomethylmalic acid synthase - Streptomyces hygroscopicus (fragment)
N:Alternate names: PMM synthase
C;Species: Streptomyces hygroscopicus
C;Species: Streptomyces hygroscopicus
C;Accesaion: BS0106
R;Shimotohno, K.W.; Imai, S.; Murakami, T.; Seto, H.
Agric. Biol. Chem. 54, 463-470, 1990
